**Introduction**

Avian taxonomy has undergone a sea change since the publication of the 3<sup>rd</sup> edition of the Howard and Moore checklist of the birds of the world (Dickinson, 2003; hereafter H&M3). As the editors point out in the introduction (p. xi) to Volume 1 of the 4<sup>th</sup> edition of that checklist (Dickinson and Christidis (eds), 2013 (v. 1, Non-Passerines), 2014 (v. 2, Passerines); hereafter H&M4):

*"The explosion of research on the phylogeny of birds in the last decade, more than in any other in history, has led to dramatic changes in our understanding of the relationships among birds. This revolution means that the classification in H&M3 is not just badly out of date but in many places virtually obsolete. From relationships among orders of birds, to composition of families and genera, to many revelations of hidden species diversity, the classification of birds of the world has undergone major changes. This explosion has been ignited by the widespread use of techniques, particularly DNA sequencing, that allow direct assessment of the genetic signature of the phylogeny of birds."*

These comments are even more relevant to the nomenclature of birds used in CITES, which still relies on a standard reference from 1975 for the names of orders and families and on another dating from 1997 for the treatment of some species of Psittaciformes.

At CoP 17, the Parties adopted Decision 17.311, directing the Secretariat to:

*a) subject to the availability of funds, commission an analysis of the implications of adopting a new standard nomenclature reference for birds at the family and order level, taking into account the 3rd and 4th editions of The Howard & Moore complete checklist of the birds of the world, and the non-passerine and passerine volume of the HBW and BirdLife International illustrated checklist of the birds of the world as well as the Animals Committee discussion regarding a new nomenclature standard reference for birds at the genus and species levels; and*

*b) report back the results to the Animals Committee.*

The present report presents the results of the analysis called for in Decision 17.311. In addition to comparing the publications referred to in the Decision at order, family, genus and species levels, the consultant also examined the other standard references for birds

listed in the Annex to Res. Conf. 12.11 (Rev. CoP 17) on *Standard Nomenclature* as well as recent taxonomic revisions and descriptions of new species of birds not addressed in either H&M4 or the HBW/Birdlife checklist (del Hoyo and Collar, 2014 (v. 1, Non-Passerines), 2016 (v. 2, Passerines); hereafter HBW/BI), for which the Parties may wish to adopt additional standard references in future. Potential nomenclatural changes to the CITES Appendices based on the references referred to in Decision 17.311 have already been summarized by UNEP-WCMC in AC 27 Doc. 25.1 (Annex 3), AC 28 Doc. 21.1 (Annex 9) and AC 30 Doc. 32 (Annex 2) (UNEP-WCMC, 2014, 2015, and 2018 respectively). These publications also include species not listed on the CITES Appendices but included in the Annex to the EU CITES regulation, and those species are omitted here.

Adopting either H&M4 or HBW/BI as the new standard reference for birds will necessitate a large number of changes from current CITES nomenclature in both the Appendices as well as the Checklist of Species / SpeciesPlus. Table 3 presents a full annotated list of all bird species currently included in the Appendices to CITES (i.e., based on the sum total of nomenclatural standard references adopted at CoP17), arranged alphabetically by order, family and species names as given in Species+, with the names used for these taxa in H&M4 and HBW/BI and notes indicating standard references for names in Species+ that differ from those used in H&M3. Table 2 presents a summary table showing the analogous information for higher taxon levels only. In both tables 2 and 3 names have been highlighted to indicate both changes between H&M4 and HBW/BI and the names currently in use and differences in treatment between H&M4 and HBW/BI.

#### **Differences in Taxonomic Approach between H&M4 and HBW/BI**

Although H&M4 and HBW/BI are largely in agreement on classification at order, family and, to a lesser extent, genus levels they differ considerably in their approach to species, with HBW/BI recognizing many species ‘splits’ that are not recognized in H&M4. In part, as HBW/BI is a slightly more recent publication than H&M4, this may reflect a growing trend towards increased splitting of species in ornithological taxonomic research, a trend that has continued since the publication of the last volume of HBW/BI (see below). However, there are also conceptual differences in approach between the two checklists, and it is worthwhile to examine briefly the nature of the differences between the two, as explained at length in their introductions.

H&M4 is avowedly conservative:

*“Although many of these opinions [on bird relationships], typically from astute field ornithologists, will sooner or later be shown to be correct, our conservative approach is to wait until actual data or explicit rationale has been published in technical literature. Even the technical literature often contains results that, in our opinion, require independent confirmation, particularly if based on small sample sizes with respect to genes, populations, or taxa.”* (Introduction to v. 1, p. xi)

In its approach to species-level classification, H&M4 adopts the Biological Species Concept (BSC), based on a determination as to whether two populations have reached a threshold of difference at which they can no longer freely exchange genes, noting that “*Assessing whether allopatric populations have reached that threshold will never be a completely satisfactory exercise but at least is amenable to experimental evidence*” (Introduction to v. 1, p. xiv). The editors specifically reject the Phylogenetic Species Concept (PSC), based on minimum diagnosable units, noting that their definition of subspecies is essentially identical to the definition of species used in the PSC.

HBW/BI, by contrast, takes a more radical approach, motivated in part by conservation concerns:

*“Given that conservation very largely takes the species as its unit of concern, and that the future of many taxa might in part depend on their recognition or not as species... it has been increasingly frustrating to have to wait — frequently in vain — for authoritative decisions from other sources over whether form A or form B is a species or subspecies.”*  
(Introduction to v.1, pp. 19-20)

In a lengthy and extensively illustrated introduction, the authors of HBW/BI review the history of the BSC, PSC and other approaches, pointing out the weaknesses and difficulties of relying exclusively on each. Instead, they adopt a series of quantitative criteria for assessing species rank (the ‘Tobias criteria’) developed by Birdlife International (Tobias et al., 2010):

*“We calculated mean levels of differentiation in multiple phenotypic characters – including biometrics, plumage and voice – for 58 sympatric or parapatric species-pairs from 29 avian families. We then used estimates of mean divergence to develop criteria for species delimitation based on data-driven thresholds. Preliminary tests show that these criteria result in relatively few changes to avian taxonomy in Europe, yet are capable of extensive reassignment of species limits in poorly known tropical regions. While we recognize that species limits are in many cases inherently arbitrary, we argue that our system can be applied to the global avifauna to deliver taxonomic decisions with a high level of objectivity, consistency and transparency.”* (Tobias et al., 2010: Abstract)

Application of the Tobias criteria can provide a classification intermediate between those that would result from strict application of either the BSC or PSC. The authors of HBW/BI provide (Introduction to v.1, p. 32) an illustrated example of particular relevance to CITES, noting that strict application of the BSC to the *Trichoglossus haematodus* complex would result in recognition of a single polytypic species (although H&M4, which relies on the BSC, recognizes five) while strict application of the PSC would result in recognition of 21 monotypic species. Application of the Tobias criteria yields a classification of the complex into seven species, three of which are monotypic and four polytypic (see further discussion of this complex below).

The conservative approach in H&M4 mirrors that used for nomenclatural decisions within CITES. However, as the advantages of using HBW/BI, based both on its format and its adoption by the Convention on Migratory Species and other bodies (see below), are nonetheless considerable, Parties may feel that they outweigh the challenges that would be posed by the adoption of a more radical (though in places more up-to-date) treatment.

### Practical Considerations: Psittaciformes

Although most of the species-level changes in both H&M4 and HBW/BI relate to species listed at the family level in the Appendices, Parties will still have to consider the implications of these changes for CITES implementation. This may be particularly relevant for Psittaciformes. Of the 30 species splits (including splits into multiple species) in Psittaciformes noted in Table 3, 17 are recognized in HBW/BI but not in H&M4. These include several that may have an impact on CITES implementation issues, including the split of *Psittacus erithacus* into two species, *P. erithacus* and *P. timneh*. In three cases for which splits in Psittaciformes are recognized in both references, HBW/BI recognizes more species than does H&M4 (for example, H&M4 splits *Pyrrhura picta* into four species while HBW/BI recognizes six). In only one case, that of *Pezoporus wallicus*, does H&M4 accept a split not recognized in HBW/BI.

Proposed splits in Psittaciformes were also an issue when H&M3 was adopted. The Nomenclature Committee, in its report to CoP13 (CoP13 Doc. 9.3.1), recommended that H&M3 not be adopted as the new standard reference for birds on the grounds that “A first analysis by UNEP-WCMC shows that adopting the Dickinson checklist would involve a very large number of changes which are not satisfactorily justified” (par. 37). By CoP14, the situation had changed following Decision 13.94, which required the Nomenclatural Committee to propose both H&M3 and Dickinson (2005), its fourth set of corrigenda, as new species-level standard references for birds. The Committee, in what was to be its final report as an independent body (CoP14 Doc. 8.5 para. 10), noted with respect to Psittaciformes that:

*“Information on necessary changes with regard to a possible adoption of these references were discussed at the 2006 meeting of the Nomenclature Committee and are available on the CITES website. According to Dickinson Psittacula intermedia has to be regarded as a hybrid between Psittacula cyanocephala and P. himalayana. However, adopting this view would create implementation problems under CITES. It is therefore proposed to keep the name of Psittacula intermedia under CITES. Dickinson splits the current species Trichoglossus haematodus into five species: haematodus, capistratus, forsteni, rubritorquis and weberi. There may be technical implementation problems with regard to this change. Specialists disagree on whether some of these taxa are easily identifiable by morphological means. In addition these taxa are not geographically distinct with regard to*

*the country of origin. Therefore it is proposed to keep the name of Trichoglossus haematodus in its current interpretation and still treat the taxa capistratus, forsteni, rubritorquis and weberi as subspecies.”*

Specific issues regarding Psittaciformes will be discussed further below. In general, however, if the Parties choose to select HBW/BI over H&M4 as a general standard reference for birds, they may wish to consider other options for Psittaciformes if they have concerns about the number of newly-recognized species that would be recognized as a result. These could include:

1. *Adopting H&M4, which is more conservative in its taxonomic approach, as the standard reference for Psittaciformes.* This would reduce the number of splits in the family but would retain the five-way split of *Trichoglossus haematodus* that raised concerns at CoP14 (see discussion below).
2. *Retaining the existing set of standard references for Psittaciformes.* This could either be done as an interim measure or for the foreseeable future [in this context, it is worth noting that following CoP17, there are 8 additional standard references in effect that are specific to 10 species of Psittacidae].
3. *Retaining existing standard references only for certain species.* In particular, Parties may wish to retain Collar (1997) for the *Trichoglossus haematodus* complex and Coetzer et al. (2015) for *Poicephalus robustus* and *P. fuscicollis* (see below).
4. *Consider adopting another standard reference for Psittaciformes that is more recent than Collar (1997) but generally preserves a conservative taxonomic approach.* A possible candidate may be Forshaw (2006) (or its concise, field-guide format successor Forshaw (2010)). Forshaw (2006) was specifically designed, in part, “*to meet the needs of... officials administering national or international conservation programs, including the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES)* (Preface, p. xi).” It shares with HBW/BI the advantage of coloured illustrations of each species and well-marked subspecies, and range maps for each species, but lacks detailed taxonomic notes.

The taxonomy used in Forshaw (2006) differs from that in both H&M4 and HBW/BI in recognizing only two psittaciform families, Cacatuidae and Psittacidae, and in retaining in their traditional genera many species transferred to other genera in both H&M4 and HBW/BI (e.g., retaining in *Aratinga* the New World conures transferred to *Eupsittula* and *Psittacara* in H&M4 and HBW/BI). In general the species-level classification in Forshaw (2006) matches that of the current Appendices where they differ from H&M4 and HBW/BI, with the following exceptions (7 splits, 1 lump, 1 species treated as a hybrid):

1. *Aratinga holochlora* is split into four species (*holochlora* (including ssp. *brewsteri*), *strenua*, *brevipes* and *rubritorquis*). Species+ and H&M4 treats these as a single species, while HBW/BI recognizes two, *holochlora* (as *Psittacara holochlorus*) and *rubritorquis*.

2. *Cyanorhamphus cooki* and *C. saissetti* are included in *C. novaezelandiae* (as in HBW/BI).
3. *Loriculus amabilis* is split into two species (*amabilis* and *sclateri* (including ssp. *ruber*)). This treatment is followed in both H&M4 and HBW/BI.
4. *Loriculus aurantiifrons* is split into two species (*aurantiifrons* (including ssp. *batavorum* and *meeki*) and *tener*). This treatment is followed in both H&M4 and HBW/BI.
5. *Pionus tumultuosus* is split into two species (*tumultuosus* and *seniloides*). This treatment is followed in HBW/BI.
6. *Prioniturus montanus* is split into two species (*montanus* and *waterstradti* (including ssp. *malindangensis*)). This treatment is followed in both H&M4 and HBW/BI.
7. *Psittacula intermedia* is listed and illustrated (as “*Psittacula intermedia*”) but is treated as a hybrid.
8. *Pyrrhura leucotis* is split into two species (*leucotis* and *emma* (including ssp. *auricularis*)). This treatment is followed in HBW/BI.
9. *Pyrrhura picta* is split into six species (*picta*, *amazonum* (including ssp. *microtera*), *lucianii*, *peruviana*, *snethlageae* and *roseifrons*). This treatment (with some differences at the subspecies level) is followed in HBW/BI; H&M4 recognizes four species (*picta*, *amazonum*, *lucianii*, and *roseifrons*).

In addition, *Pyrrhura parvifrons*, described in 2008, is listed in Forshaw (2010) but not in Forshaw (2006). This species is included in Species+; the Parties have adopted Arndt (2008) as a standard reference. Note also that if Forshaw (2006) were to be adopted, Coetzer et al. (2015) would have to be retained as a standard reference if Parties wish to preserve the split between *Poicephalus robustus* and *P. fuscicollis*.

### Specific Nomenclatural Issues

**Order and Family Names:** H&M3 did not include names at the ordinal level. For order and family-level names, the standard reference is Morony, Bock and Farrand (1975). These authors’ treatment of orders and families is now widely regarded as obsolete and not reflective of our current knowledge of bird relationships (e.g. the species listed in the family Muscicapidae in the current Appendices are now known to belong to a number of different families, some of which are only distantly related to each other). This has been the case for almost two decades; H&M3 already recognized a number of family changes that are followed in H&M4 and HBW/BI (e.g. the removal of the genera *Cnemophilus* and *Loboparadisea* from the Paradisaeidae to a new and unrelated family, Cnemophilidae). As both H&M4 and HBW/BI include order-level names, there is no reason to retain Morony, Bock and Farrand (1975) as a standard reference, and indeed it would be confusing to do so. However, Parties should be aware moving to a more modern classification will require numerous higher-level changes. In particular, the listing in Appendix II of the order Falconiformes (as Falconiformes spp.) will have to be changed into separate listings for the

new order Accipitriformes and for the redefined order Falconiformes, containing only the family Falconidae, which is now understood to be related to Psittaciformes and Passeriformes rather than to the other diurnal birds of prey.

**Tauraco spp.:** The genus *Tauraco* is included in the Appendices as a higher taxon listing. Both H&M4 and HBW/BI, however, transfer the species *porphyreolophus* to the genus *Gallirex*, which includes one other species, *G. johnstonei*, not listed in the Appendices. As the species *porphyreolophus* remains in the Appendices despite this nomenclatural change, adoption of either reference will require that *Gallirex porphyreolophus* be listed at the species level. In addition, H&M4 (but not HBW/BI) transfers the two species in the genus *Musophaga*, *M. rossae* and *M. violacea*, to *Tauraco*. As neither of these species is currently listed in the Appendices, if H&M4 is adopted the listing for *Tauraco* spp. will have to be amended to indicate that *rossae* and *violacea* are excluded. The Nomenclature Specialist (Fauna) has expressed the view that these changes are editorial in nature and will not require separate listing proposals.

**Trichoglossus haematodus complex:** Collar's treatment of Psittaciformes in the print version of HBW (Collar 1997) was retained as the standard reference for *Trichoglossus haematodus* to avoid the treatment in H&M3, which split this taxon into five species (*T. capistratus*, *T. forsteni*, *T. haematodus*, *T. rubritorquis* and *T. weberi*) (see discussion above). However, both of the proposed standard references also split *T. haematodus* into several species. H&M4 follows the species-level treatment in H&M3, recognizing five species, while HBW/BI, as noted previously, splits *T. haematodus* into seven species (*T. capistratus*, *T. forsteni*, *T. haematodus*, *T. moluccanus*, *T. rosenbergii*, *T. rubritorquis* and *T. weberi*). Parties will have to decide whether they now wish to accept the splits in this complex, to retain the existing standard reference (noting that the current reference for *T. haematodus* is now over twenty years old and has been superseded in the online version of HBW by the classification in HBW/BI), or to adopt a more recent but conservative reference such as Forshaw (2006 or 2010), which continues to recognize only a single species, *T. haematodus*.

**Amazona oratrix:** Currently *Amazona oratrix* is listed on Appendix I while the closely related *A. ochrocephala* is listed on Appendix II. In H&M3, the subspecies *magna*, which ranges from Tamaulipas to Tabasco in eastern Mexico, was included in *ochrocephala* although it is widely separated in range from the other races of that species and closely resembles *oratrix*, which otherwise occurs in western and southern Mexico and Belize. This may have been in error (presumably because *oratrix* and *ochrocephala* had previously been regarded as conspecific; see below), and no justification for the reassignment was given. Both H&M4 and HBW/BI transfer this population to *oratrix*. H&M4 retains *magna* as a subspecies of *oratrix*, and HBW/BI eliminates recognition of *magna* altogether, including the population within the nominate subspecies *A. o. oratrix*.

The potential problem for CITES is that transferring *magna* to *oratrix*, while undoubtedly correct, means that the (disputed) subspecies seems to have been shifted from a species on Appendix II to a species on Appendix I. However, it appears that, despite the arrangement in H&M3, *magna* should be considered as having been listed on Appendix I based on the intent of the original proposal. The proposal to list *A. oratrix* on Appendix I, submitted by Mexico (Prop. 12.17), specifically includes *magna* as a race of *oratrix* and maps its

distribution on Figure 1 as part of the range of that species. Unfortunately the summary document on *Amendments to the Appendices adopted at CoP12*<sup>1</sup> fails to mention *magna*, listing only the subspecies *europalliata*, *belizensis*, *caribaea*, *oratrix*, *parvipes* and *tresmariasae* as having been transferred to Appendix I. Further, it treats all of these subspecies as races of *A. ochrocephala* rather than of *A. oratrix*. This presumably reflects the fact that Collar (1997) was adopted at that meeting as the standard reference for Psittaciformes (CoP12 Doc. 10.3 (Rev. 1)). Collar (1997) treats *ochrocephala* and *oratrix* (with *A. europalliata*) as conspecific under the name *Amazona ochrocephala* and omits *magna*, apparently merging it with nominate *oratrix* whose range is given as “Pacific and Atlantic lowlands of Mexico” (p. 473). Forshaw (2006) also follows this treatment. Species+ currently lists both *Amazona ochrocephala magna* and *Amazona oratrix magna* as synonyms of *Amazona oratrix*. Hence, regardless of the trajectory taken, the population at one time referred to as *magna* is currently treated as part of *A. oratrix* and subject to Appendix I.

As noted above H&M3 was not adopted as the standard reference for birds until CoP14, and the implications of its erroneous treatment of *magna* appear to have escaped notice. In any event the adoption of either H&M4 or HBW/BI, or of Forshaw (2006), would reconfirm the existing practice and thus clear up this problem, assuming that it ever was a problem in the first place.

***Poicephalus robustus* and *P. fuscicollis*:** Until CoP17 the standard references adopted for Psittacidae had treated *Poicephalus robustus* as a single species with two subspecies, *P. r. robustus* and *P. r. fuscicollis*. At that meeting, based on a submission by South Africa (AC27 Doc. 25.2) recommended for adoption by the Animals Committee (CoP17 Doc. 81.1), the Parties adopted Coetzer et al. (2015), which recognized *Poicephalus robustus* and *P. fuscicollis* as separate species, as the standard reference for these taxa. However, both H&M4 and HBW/BI continue to regard *robustus* and *fuscicollis* as conspecific (but with *fuscicollis* as distinct and valid subspecies, alongside *P. r. suahelicus*).<sup>2</sup> If the Parties wish to retain the split between these taxa they may wish to retain Coetzer et al. (2015) as the standard reference for *robustus* and *fuscicollis* (see also the discussion of Forshaw (2006) above).

***Psittacula intermedia*:** As noted above, H&M3 treated *Psittacula intermedia* as a hybrid but the Parties decided at CoP14 not to follow this treatment. Currently the standard reference for *P. intermedia* is Collar (1997), which retains it as a good species. However, both H&M4 and HBW/BI, as well as Forshaw (2006), follow H&M3 in treating this taxon as of hybrid origin. The evidence supporting hybrid treatment appears to be strong (Rasmussen and Collar, 1999) and this treatment has been widely accepted. As very few specimens of *intermedia* are known the Parties may wish to reconsider the utility of continuing to recognize it as a separate species.

---

## **Further Standard References**

In a few cases there may be a need to adopt new species-level standard references to reflect changes since the publication of H&M4 and HBW/BI. These include newly described bird species, proposed elevation of a number of subspecies to species rank, and one case of nomenclatural confusion that requires reassignment of a recognized name and recognition of a new species (see Table 1). The Parties may wish to consider drafting a Decision directing the Nomenclature Specialist of the Animals Committee to seek consideration whether any of the publications cited in Table 1 should be adopted at CoP19 as additional standard references for these species. In the consultant's opinion this is particularly important for *Lophorina* spp., *Megascops gilesi*, and *Oreotrochilus cyanolaemus*, for which the evidence of distinctiveness appears to be strong, and for the *Strix hadorami* / *Strix butleri* complex for which both H&M4 and HBW/BI preserve a serious nomenclatural error.

Notes on these some of these proposed species follow:

***Amazona gomezgarzai* (Psittacidae):** The validity of this newly-described taxon from the Yucatán Peninsula, Mexico, has been questioned (Escalante et al., 2017).

***Anthocephala berlepschi* (Trochilidae):** A proposed split from *A. floriceps*. See discussion at <http://www.museum.lsu.edu/~Remsen/SACCprop654.htm>.

***Campylopterus calcirupicola*, *C. diamentinensis*, *C. obscura* (Trochilidae):** *C. calcirupicola* is a new species described from Minas Gerais, Brazil. In the same paper (Lopes et al., 2017) the authors propose treating the subspecies of *C. largipennis* as separate species except for *C. l. aequatorialis*, which they treat provisionally as a subjective junior synonym of *obscura*. See discussion at <http://www.museum.lsu.edu/~Remsen/SACCprop756.htm>.

***Colibri cyanotus* (Trochilidae):** Remsen et al. (2015), in a broad study of the Polytmiae, "propose that nominate [*Colibri*] *thalassinus* and the *cyanotus* group should be treated as separate species until data indicate otherwise". This split has been accepted by the American Ornithologists' Union (Chesser et al., 2016).

***Eugenes spectabilis* (Trochilidae):** This split has been accepted by the American Ornithologists' Union (Chesser et al., 2017).

***Lophorina niedda*, *Lophorina minor* (Paradisaeidae):** Splits resulting from a review of the genus on molecular, morphological and behavioural grounds. The separation of *L. niedda* has been supported by studies of its courtship displays (Scholes & Laman, 2018).

***Megascops gilesi* (Strigidae):** This taxon, which has awaited description for a number of years, was described from the Santa Marta Mountains in Colombia. It appears to be a distinctive new species with no close relatives within *Megascops*. See discussion at <http://www.museum.lsu.edu/~Remsen/SACCprop769.htm>.

***Northiella narethae* (Psittacidae):** A split based on a molecular study (Dolman & Joseph (2015)) showing that the isolated subspecies *narethae* from the Nullarbor Plains, Australia, is genetically distinct from all other populations of *N. haematogaster*.

***Ocreatus addae*, *Ocreatus annae*, *Ocreatus peruanus* (Trochilidae):** Split resulting from a review (Schuchmann et al., 2016) of the genus, recognizing *addae*, *annae*, and *peruanus* as monotypic species, with the subspecies *underwoodii*, *discifer*, *incommodus*, *melanantherus*, and *polystictus* retained within the polytypic *O. underwoodii*.

***Oreotrochilus cyanolaemus* (Trochilidae):** This new species, apparently endemic to the southwestern highlands of Ecuador, was described (Sornoza-Molina, 2018) on the basis of “striking” plumage differences from related species. It is probably closest to *O. stolzmanni*. The authors evaluate it as Critically Endangered based on its limited distribution and lack of protection of its habitat.

***Otus cypricus* (Strigidae):** The scops owl population of Cyprus is split off as an endemic species on the basis of plumage and vocalizations from the widespread *Otus scops*. See also Flint & Richardson (2017).

***Strix ‘omanensis’ / Strix hadorami / Strix butleri* (Strigidae):** The names of the owls *Strix butleri* and the recently-described *S. omanensis*, both listed in HBW/BI, have been a source of confusion because of the uncertain provenance of the type specimen of *butleri* and the fact that *omanensis* was described based on photographs and recordings, without tangible specimen evidence (Brewer, 2018). *Strix butleri* is listed in H&M3 and H&M4, but *omanensis* was described too late to be included in these publications. Robb et al. (2015) were able to obtain a cytochrome *b* sequence from a presumed *omanensis* netted in Iran, and demonstrated that this was identical to a sequence from the type specimen of *butleri*. As a consequence the name *butleri* had to be shared with the population described as *omanensis*, while the population generally referred to as *butleri* required a new name. Kirwan et al. (2015) reviewed the entire complex, reserved the name *butleri* (with *omanensis* as a synonym) to the populations of Iran and the eastern Arabian Peninsula, and described the populations of the western parts of the Middle East formerly attributed to *S. butleri* as a new species, *S. hadorami*. This change has been adopted in the online version of HBW, which follows Kirwan et al. (2015) in assigning the name *hadorami* to the populations formerly known as *butleri* (Desert Tawny Owl) and *butleri* to the populations described as *omanensis* (Omani Owl). As this reflects a correction of a nomenclatural error, Parties may wish to adopt Kirwan et al. (2015) as a standard reference for *S. hadorami* and Robb et al. (2015) as a standard reference for *S. butleri*.

***Tyto furcata*, *Tyto javanica* (Tytonidae):** Aliabadian et al. (2016) propose splitting *Tyto alba* into three species, *T. alba* (Africa, Europe), *T. furcata* (New World), and *T. javanica* (Australasia), based on a phylogenetic and ecological review. This split has been supported in a recent molecular study (Uva et al., 2018).

**Table 1.** Newly described bird species and proposed species splits published after the cutoff dates for H&M4 and Volumes 1 and 2 of the HBW and BirdLife International Illustrated Checklist of the Birds of the World (staggered cutoff dates in early 2014 for HBW/BI Volume 1; 31 August 2016 for HBW/BI Volume 2; cutoff dates for H&M4 were earlier, in mid-2011 and 31 December 2013).

Family	Species	Proposed Change	Reference	Status in HBW Alive <sup>3</sup>
Trochilidae	<i>Amazilia hoffmanni</i>	Split from <i>A. saucerottei</i> / spelling of <i>saucerottei</i> corrected (was <i>saucerrottei</i> )	Jiménez & Ornelas (2016)	Not discussed
Trochilidae	<i>Anthocephala berlepschi</i>	Split from <i>A. floriceps</i>	Lozano-Jamarillo et al. (2014)	Not discussed
Trochilidae	<i>Calliphlox lyrura</i>	Split from <i>C. evelynae</i>	Feo et al. (2015)	Not discussed
Trochilidae	<i>Campylopterus calcirupicola</i>	New species	Lopes et al. (2017)	Under review
Trochilidae	<i>Campylopterus diamantinensis</i>	Split from <i>C. largipennis</i>	Lopes et al. (2017)	Not discussed
Trochilidae	<i>Campylopterus obscura</i>	Split from <i>C. largipennis</i>	Lopes et al. (2017)	Not discussed
Trochilidae	<i>Colibri cyanotus</i>	Split from <i>C. thalassinus</i>	Remsen et al. (2015)	Not discussed
Trochilidae	<i>Eugenes spectabilis</i>	Split from <i>E. fulgens</i>	Zamudio-Beltrán & Nernández-Baños (2015)	Not discussed
Trochilidae	<i>Ocreatus addae</i>	Split from <i>O. underwoodii</i>	Schuchmann et al. (2016)	Not discussed
Trochilidae	<i>Ocreatus annae</i>	Split from <i>O. underwoodii</i>	Schuchmann et al. (2016)	Not discussed
Trochilidae	<i>Ocreatus peruanus</i>	Split from <i>O. underwoodii</i>	Schuchmann et al. (2016)	Not discussed
Trochilidae	<i>Oreotrochilus cyanolaemus</i>	New species	Sornoza-Molina (2018)	Under review
Paradisaeidae	<i>Lophorina minor</i>	Split from <i>L.</i>	Irestedt et al.	Not discussed

<sup>3</sup> Retrieved 4 November 2018

Family	Species	Proposed Change	Reference	Status in HBW Alive <sup>3</sup>
		<i>superba</i>	(2017)	
Paradisaeidae	<i>Lophorina niedda</i>	Split from <i>L. superba</i>	Irestedt et al. (2017)	Not discussed
Psittacidae	<i>Amazona gomezgarzai</i>	New species	Silva et al. (2017)	Under review
Psittacidae	<i>Northiella narethae</i>	Split from <i>N. haematogaster</i>	Dolman & Joseph (2015)	Not discussed
Psittacidae	<i>Pyrrhura chapmani</i>	Split from <i>P. melanura</i>	Donegan et al. (2016)	Not discussed
Strigidae	<i>Megascops gilesi</i>	New species	Krabbe (2017)	Under review
Strigidae	<i>Ninox fusca</i>	Split from N. boobook	Gwee et al. (2017)	Not discussed
Strigidae	<i>Ninox hantu</i>	Split from N. squamipila	Gwee et al. (2017)	Not discussed
Strigidae	<i>Ninox plesseni</i>	Split from N. boobook	Gwee et al. (2017)	Not discussed
Strigidae	<i>Ninox rotiensis</i>	Split from N. boobook	Gwee et al. (2017)	Not discussed
Strigidae	<i>Otus cyprius</i>	Split from <i>O. scops</i>	Flint et al. (2015)	Not discussed
Strigidae	<i>Strix 'omanensis' / Strix hadorami / Strix butleri</i>	Split and nomenclatural change	Kirwan et al. (2015) [S. hadorami]; Robb et al. (2015) [S. butleri]	S. hadorami adopted / S. omanensis synonymized with S. butleri
Tytonidae	<i>Tyto furcata</i>	Split from <i>T. alba</i>	Aliabadian et al. (2016)	Not discussed
Tytonidae	<i>Tyto javanica</i>	Split from <i>T. alba</i>	Aliabadian et al. (2016)	Not discussed

#### Comparative Features of H&M4 and HBW/BI

Both H&M4 and HBW/BI are authoritative checklists, each with their own advantages and disadvantages from a CITES perspective. In deciding which to adopt as CITES nomenclatural standard reference for birds, Parties may wish to take into account, in addition to their differences in taxonomic approach, other features of the two publications that may affect their usefulness.

**Format and content:** H&M4 and HBW/BI are each published in two hardcover volumes, with the first volume devoted to non-passerines (i.e., all birds not belonging to the order Passeriformes) and the second to passerines. Volume 1 of H&M4 contains 461 pages, with 752 pages in Volume 2. In addition, both H&M4 volumes come with a CD-ROM containing supplementary material, including (in v.2) a spreadsheet containing the full classification to subspecies level. The volumes of HBW/BI, with their added pictorial content, are considerably larger and heavier (903 + 1012 = 1915 pages, including 803 plates with 20919 colour illustrations). They are correspondingly more expensive; for comparison, the two-set volume of H&M4 can be purchased for about GBP 100, online, while both volumes of HBW/BI will cost about £350.00. Spreadsheet versions of the names used in each can be downloaded from the internet without charge, and in the case of HBW/BI can be searched without a subscription fee on the HBW Alive web site (see below).

**H&M4:** In addition to the main checklist, both volumes of H&M4 include an introduction, a chapter (by Joel Cracraft) on ‘Avian higher-level relationships and classification’, a Table of Contents including page references to past checklists (including H&M3), a statistical table giving numbers of genera, species and subspecies (including extinct taxa) included in each family, and appendices covering nomenclature of the higher classificatory ranks of birds (by Richard Schodde), matters of nomenclature and taxonomy, English names (by D.R. Wells, R.J. Dowsett and L. Svensson), variable species-group names and their gender endings (by Norman David and Michel Gosselin), as well as an index and list of references.

**HBW/BI:** Each volume of BI contains an introduction on taxonomic methods (34 pp. in v.1, 7 pp. in v.2), appendices covering extinct species, and a bibliography and index. Volume 1 also contains a series of reference maps. In their introduction, the authors of HBW/BI set out the features that make its approach unique (and, in the consultant’s opinion, greatly increase its practical usefulness to the CITES Parties):

*“This work has several features — other than the length of its introduction — that set it somewhat apart from other checklists. It illustrates each species in colour; it updates as accurately as space allows the written ranges of both species and subspecies, and provides a newly revised map; it gives French, German and Spanish as well as common alternative English names; and where appropriate it offers some information about the taxonomic relationships of particular species.”* (Introduction to v.1, p. 19)

HBW/BI therefore has, among other things, the ability to serve not only as a standard reference for nomenclature but to some extent as an identification manual and a useful source of information on species distribution, common names in all three official CITES languages, and the rationales for particular taxonomic decisions.

**Presentation of the checklist: H&M4:** H&M4, like H&M3, does not use taxa above the level of family in the main checklist; it does do so, however, in the Table of Contents. Each family entry is followed by numbers (in parentheses, separated by a colon) indicating the number of genera and species in each family. For polytypic species, subspecies are listed below each species name. Extinct taxa are indicated with a dagger symbol (†). A “v” indicates that the name is *variable*; that is, its ending will change depending on the gender of the genus it is assigned to. Footnotes at the bottom of each page provide taxonomic and other notes, but are not provided for every species. A sample entry illustrating the presentation format used (with footnotes) is as follows:

STRUTHIONIDAE, RHEIDAE, TINAMIDAE

**STRUTHIONIDAE - OSTRICHES (1:2)**

*STRUTHIO* Linnaeus, 1758 M – *Struthio camelus* Linnaeus, 1758; type by subsequent designation (G.R. Gray, 1840, A List of the Genera of Birds, p. 63).

*Struthio camelus* COMMON OSTRICH<sup>1</sup>

†*syriacus* Rothschild, 1919  
  *camelus* Linnaeus, 1758<sup>2</sup>

*massaicus* Neumann, 1898  
  *australis* J.H. Gurney Sr., 1868

- v Syrian and Arabian deserts  
S Morocco and Mauritania to Sudan, N and W Ethiopia, N Uganda
- v S Kenya to C Tanzania
- v S Angola, Namibia, Botswana, SW Zimbabwe, W and N South Africa

*Struthio molybdophanes* Reichenow, 1883 SOMALI OSTRICH<sup>3</sup>

Somalia, SE Ethiopia, N and E Kenya

<sup>1</sup> For suggested split of southern populations see Miller *et al.* (2011) [1656].

<sup>2</sup> Introduced (ssp *australis*) widely in South Africa, also Zambia (where wild populations extinct).

<sup>3</sup> For treatment as an allopecies separate from *S. camelus*, see Freilag & Robinson (1993) [833].

**HBW/BI:** HBW/BI uses order-level names in the main checklist. Family-level English names are provided in the Table of Contents rather than in the main text. Entries are presented in double columns on the left-hand side of each double-page spread. On the right-hand side are coloured illustrations of each species and well-marked subspecies (mostly drawn from the *Handbook of the Birds of the World* (del Hoyo *et al.* (eds.), 1992–2013, hereafter HBW)). IUCN Red List status is shown in colour-highlighted type and a reference is provided to the entry for each species in HBW. Detailed taxonomic notes are provided for each species entry. Sample spreads can be viewed on the publisher’s website<sup>4</sup>. The text for the entry on Struthionidae (footnotes, which link to references in the general bibliography, omitted) is as follows:

<sup>4</sup> <https://www.lynxeds.com/product/hbw-and-birdlife-international-illustrated-checklist-birds-world-0>

## Order STRUTHIONIFORMES

### Family STRUTHIONIDAE

Genus *STRUTHIO*

Linnaeus, 1758

#### 1. *Struthio camelus*

**Common Ostrich** LC

HBW 1: 83

**French:** Autruche d'Afrique / **German:** Strauß / **Spanish:** Avestruz común

**Other common names:** Ostrich (when lumped with *S. molybdophanes*)

**Taxonomic notes.** *Struthio camelus* Linnaeus, 1758, Syria, Arabia, Libya, Africa = Sennar (south-east Sudan). Previously considered conspecific with *S. molybdophanes*, but differs significantly in plumage and bare parts, genetically and behaviourally (see below). S race *australis*, with bluish neck, sometimes suggested to be a separate species, but differences are less marked than those of *molybdophanes*, in addition to which it appears genetically very similar to nominate and especially *massaicus*<sup>103, 152</sup>. Race *tsyriacus* (Arabia), closely related to nominate<sup>104</sup>, extinct probably since 1960s. NW populations (Rio de Oro) previously separated in race *spatzii* on basis of different pattern and structure of pores in eggshells, but detected differences now attributed to individual variation<sup>102, 119, 400</sup>. Three extant subspecies recognized.

#### Subspecies and Distribution.

- † *S. c. syriacus* Rothschild, 1919 – deserts of Syria and Arabia.
- *S. c. camelus* Linnaeus, 1758 – W & S Sahara, and Sahel, from Mauritania E to Sudan and Eritrea, S to N Uganda.
- *S. c. massaicus* Neumann, 1888 – S Kenya S to Tanzania.
- *S. c. australis* Gurney, Sr., 1868 – S Angola E to Zimbabwe and S Mozambique, and S to W & N South Africa. Introduced to other parts of South Africa and locally in NW & SC Australia.

#### 2. *Struthio molybdophanes*

**Somali Ostrich**

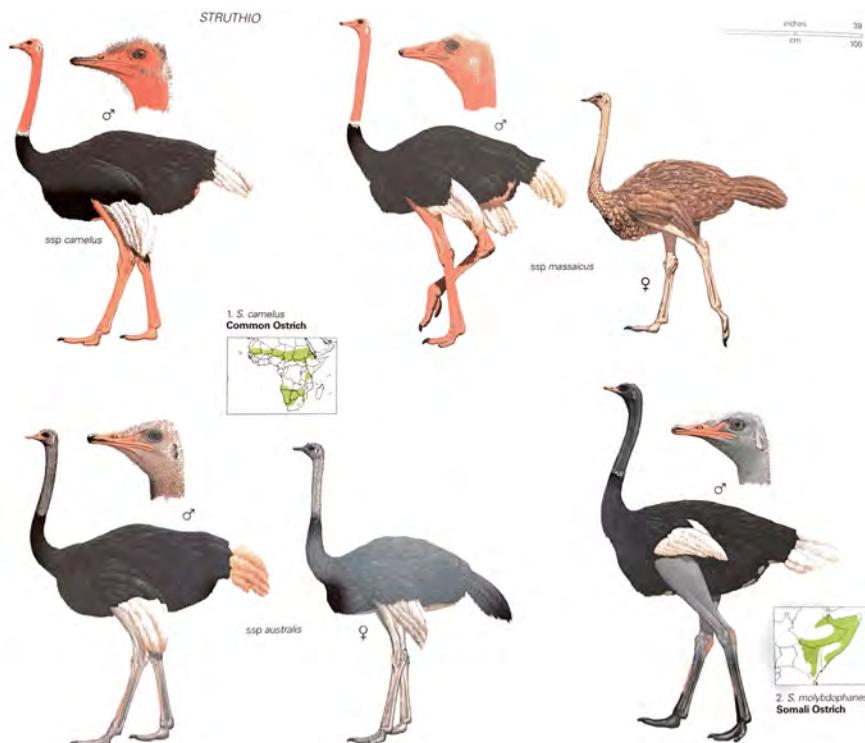

HBW 1: 83 as *Struthio camelus molybdophanes*

**French:** Autruche de Somalie / **German:** Somalistrauß / **Spanish:** Avestruz somalí

**Taxonomic notes.** *Struthio molybdophanes* Reichenow, 1883, Somalia.

Long considered conspecific with *S. camelus*, but since turn of century commonly given species status, and this view accepted here on basis of strong grey-blue vs pink, reddish or pinkish-grey neck and legs (3); deeper black plumage (1); black scutes on lower tarsi (1); pale brownish-grey (or greyish-blue in female) vs dark brown eye (1); bare crown with raised horny hump (2); parapatric distribution with nominate *camelus* in Ethiopia<sup>96</sup> and evidently virtually so with *massaicus* in Kenya<sup>106, 1029</sup> (3). Genetic study<sup>103</sup> also strongly supports this separation. Monotypic.

**Distribution.** S & SE Ethiopia, Djibouti and Somalia S to N & E Kenya.

**Updates: H&M4:** A fifth edition of the Howard and Moore Checklist is to be edited by Les Christidis and published under the auspices of the Trust for Avian Systematics, which owns the intellectual property involved in the work (E.C. Dickinson, *pers. comm. to R. Orenstein*, 8 November 2018). No publication date has been announced. A card in the back of v.1 of H&M4 refers to downloadable updates to the list, but these are no longer available on the website of Aves Press which will not be involved in the 5<sup>th</sup> edition. Instead, a separate website has been established on a site hosted by Bird Studies Canada (<https://www.howardandmoore.org/>, accessed 9 November 2018). A download page on this site (<https://www.howardandmoore.org/howard-and-moore-database/>) provides access to the database as published in H&M4 in MS Excel format (referred to as Version 4.0), errata and corrigenda for each volume in PDF format, and a revised version 4.1, also in MS Excel format, released in August 2018.

**HBW/BI:** In the introduction to v.1, the authors note that “...we expect there to be a number of revised editions of this checklist in the coming decades”. In the meantime, Birdlife International is maintaining a download page (<http://datazone.birdlife.org/species/taxonomy>) that provides Excel and PDF versions of the current checklist (names and associated information only, with links to Birdlife factsheets for each entry), PDF versions of the introductions to each volume, archives of versions of the Birdlife checklist including Version 2 (December 2017), listed (as of 10 November 2018) as the current version, and a list of taxonomic sources, many with links.

In addition, as of March 2017 the taxonomy in HBW/BI has been fully integrated with the online version of the *Handbook of the Birds of the World* (HBW Alive, [www.hbw.com](http://www.hbw.com)). This means that for each species listed in HBW/BI there is a detailed separate account in HBW Alive, including updates from the original entries in the print version of the Handbook, additional illustrations, references, and links to thousands of audiovisual files including photographs, videos and sound recordings. Access to the full site requires an annual subscription, currently 29.95 € per year (<https://www.hbw.com/subscription-plans>), but basic information can be accessed without charge.

**Adoption by other institutions and MEAs:** H&M4 has not been adopted as a reference by other MEAs, but there has been very widespread utilisation of the list by museum curators and their staff in all regions of the world (E.C Dickinson, *pers. comm.*). HBW/BI has been adopted as a taxonomic and nomenclatural standard by the European Bird Census Council (EBCC), the European Union (with respect to its Birds Directive), the Convention on the Conservation of Migratory Species of Wild Animals (CMS), the Agreement on the Conservation of African-Eurasian Migratory Waterbirds (AEWA), and IUCN (including the IUCN Red List of Threatened Species)<sup>5</sup>.

---

<sup>5</sup> (see <https://www.lynxeds.com/product/hbw-and-birdlife-international-illustrated-checklist-birds-world-0> for details; accessed 10 November 2018).

## **Recommendations**

1. The decision of the Parties on whether to adopt H&M4 or HBW/BI as the new standard reference for birds should be based on a comparison of taxonomic differences on the one hand, and of features and synergies on the other. As CITES has, in the past, taken a conservative approach to nomenclature, and because the number of changes to current usage (including the number of new species that would have to be recognized) would be much lower, H&M4 may be the more attractive option on taxonomic grounds alone (but see Recommendation 3 below). However, the additional features in HBW/BI (e.g., coloured illustrations, range maps, names in all three CITES languages, detailed taxonomic notes, and integration with the online *Handbook of the Birds of the World* site HBW Alive), as well as its adoption by, *inter alia*, the Convention on Migratory Species (CMS) and the EU, may make it a better choice on the basis of features and synergies with other bodies.
2. Advances in avian taxonomy, particularly since the turn of the century, have not only been sweeping but have, by now, been broadly accepted in principle and are widely accepted in the literature. H&M4 and BW/BI, despite their differences, both represent modern standards in this area. If one of these is adopted by the Parties, the adoption of older works for particular taxa as standard references in order to avoid perceived difficulties in adapting to changed taxonomies should only be done when absolutely necessary (with the possible exception of retaining Coetzer et al. (2015) for *Poicephalus robustus* and *P. fuscicollis*).
3. Most of the species splits recognized in H&M4 and (particularly) HMW/BI involve species listed at higher taxon levels (e.g., Trochilidae, Accipitridae (“Falconiformes”), Strigidae) and are unlikely to create difficulties for CITES. Psittaciformes remain a possible exception. If Parties find that the treatment of this order in both H&M4 and HBW/BI would create difficulties that they are unable to accept, they may wish to instruct the Nomenclature Specialist of the AC to examine the merits of adopting Forshaw (2006) as the standard reference for Psittaciformes.
4. Parties should consider adopting a Draft Decision directing the Nomenclature Specialist of the AC to seek consideration of the references concerning species described or named since the publication of HBW/BI v.2 (Table 1) to determine if any of these should be adopted as further standard references for birds, and to provide recommendations in his reports to the Animals Committee and Conference of the Parties. This is particularly necessary for Kirwan et al. (2015) for *Strix hadorami* and Robb et al. (2015) for *Strix butleri*, and may also be desirable for *Lophorina* spp., *Megascops gilesi*, and *Oreotrochilus cyanolaemus* among others.

**Table 3.** Annotated list of all bird species currently included in the Appendices to CITES, comparing names used in Species+ with the names used for these taxa in the 4<sup>th</sup> edition of Howard and Moore (Dickinson and Christidis (eds), 2013 (v. 1, Non-Passerines), 2014 (v. 2, Passerines)) and the HBW/Birdlife checklist (del Hoyo and Collar, 2014 (v. 1, Non-Passerines), 2016 (v. 2, Passerines)). Notes indicate names in Species+ that differ from those used in the 3<sup>rd</sup> edition of Howard and Moore (Dickinson, 2003; hereafter H&M3) as the result of the adoption of alternate standard references listed in the Annex to Res. Conf. 12.11 (Rev. CoP 17).

In the following table names in red differ from names used in Species+, either as a result of taxonomic changes, reassignment of subspecies from one species to another, or spelling emendations. Names in **boldface** differ in treatment between the Howard and Moore 4 and HBW/Birdlife checklists. Taxonomic ‘splits’ that would result from the adoption of either checklist are highlighted in grey, and ‘lumps’ are highlighted in yellow. Under Species+ species names in blue are listed on Appendix I, and species names in green are listed on Appendix III; all other species are listed on Appendix II.
