*Table 1. Published ‘estimates’ of the total (global) wild Asian elephant population (modified and updated from Blake and Hedges (2004); also see Figure 1 in Annex 1).*

Population ‘estimates’			Area of elephant range (km <sup>2</sup> )	Year	Source
Minimum	Probable	Maximum			
28,000	–	42,000	–	1978	Olivier (1978)
23,000	–	41,000	–	1982	Shoshani and Eisenberg (1982)
34,470	–	53,710	–	1990	Santiapillai and Jackson (1990)
34,390	–	56,045	436,230	1992	Sukumar (1992)
35,000	–	50,000	–	1995	WWF (2002a), who note that the data are based on 1995 ‘rough estimates’ and that several populations have experienced steep declines since that time
34,594	42,705	50,998 identified as ‘speculative numbers’	–	2000	Kemf and Santiapillai (2000), the authors cite the IUCN/SSC Asian Elephant Specialist Group (AsESG) as the source of their data and warn that almost all figures are very approximate
34,594	–	50,998	–	2000	WWF (2002b), who cite the AsESG as their source and note that all figures are very approximate
41,410	–	52,345	486,800	2003	Sukumar (2003)
Unknown	Unknown	Unknown	878,639	2008	2008 AsESG/WWF/WCS mapping and strategic planning workshops

Table 2. Status of Asian elephant populations (adapted and updated from Choudhury et al., (2008); also see Figure 1 in Annex 1.

Range State	Status
Bangladesh	In Bangladesh, the species was once widespread, but today it is largely restricted to areas that are relatively less accessible to humans, mainly Chittagong and the Chittagong Hill Tracts in the southeast. In addition, some animals periodically visit the New Samanbag area of Maulvi Bazar District under the Sylhet Forest Division in the north-east of the country, coming from the neighbouring Indian states of Tripura, Meghalaya and Assam.
Bhutan	In Bhutan, all the existing elephant populations are found along the border with India. They are reported from Royal Manas National Park, Namgyal Wangchuk Wildlife Sanctuary, Phipsoo Wildlife Sanctuary, and the Reserve Forests, such as Khaling Wildlife Sanctuary, Dungsum and Mochu. In the past, elephants made seasonal migrations from Bhutan to the grasslands of India during the wetter summer months of May to October, returning to their winter range in Bhutan from November. Now these movements are restricted as a result of loss of habitat on the Indian side and fragmentation of habitat on the Bhutan side.
Cambodia	In Cambodia, elephants are primarily found in the mountains of the south-west and in Mondulkiri and Ratanakiri Provinces. Recent surveys in Mondulkiri Province suggest that important numbers may remain in that area (Pollard et al., 2008; WWF, unpubl. data). Elsewhere, Asian elephants persist in Cambodia in only small, scattered populations (Duckworth and Hedges, 1998).
China	In China, Asian elephants once ranged widely over much of southern China, including the Fujiang, Guangdong and Guangxi Provinces (Smith and MacKinnon, 2008). The species was extirpated in southern Fujiang and northern Guangdong during the 12th century, but evidence indicates persistence in Guanxi into the 17th century (Smith and MacKinnon, 2008). All that now remains of this once widespread elephant population in China is the remnant in Yunnan where the species survives in small numbers in three prefectures: Xishuangbanna, Simao and Lincang.
India	Once widespread in India, the species is now restricted to four general areas: north-eastern India, central India, north-western India and southern India. In north-eastern India, the elephant range extends from the eastern border of Nepal in northern West Bengal through western Assam along the Himalaya foothills as far as the Mishmi Hills. From here it extends into eastern Arunachal Pradesh, the plains of upper Assam and the foothills of Nagaland. Further west, it extends to the Garo Hills of Meghalaya through the Khasi Hills, to parts of the lower Brahmaputra plains and Karbi Plateau. Elsewhere in the south in Tripura, Mizoram, Manipur, and the Barak valley districts of Assam, isolated herds occur (Choudhury, 1999). In central India, highly fragmented elephant populations are found in the States of Orissa, Jharkhand and the southern part of West Bengal, with some animals wandering into Chattisgarh. In north-western India, the species occurs in six fragmented populations at the foot of the Himalayas in Uttarakhand and Uttar Pradesh, ranging from Katarniaghata Wildlife Sanctuary in Bahraich Forest Division in the east, to the Yamuna River in the west. In southern India, elephants occur in the hilly terrain of the Western Ghats and in parts of the Eastern Ghats in the States of Karnataka, Kerala, Tamil Nadu, and, relatively recently, Andhra Pradesh. There are eight main populations in southern India, each fragmented from the others: northern Karnataka; the crestline of Karnataka–Western Ghats; Bhadra–Malnad; Brahmagiri–Nilgiris–Eastern Ghats; Nilambur–Silent Valley–Coimbatore; Anamalais–Parambikulam; Periyar–Srivilliputhur; and Agasthyamalais.
Indonesia	On Sumatra, the elephant was once widespread, but now survives only in highly fragmented populations. In the mid-1980s, 44 discrete elephant

Range State	Status
	<p>populations were known to exist in Sumatra's eight provinces, 12 of these were in Lampung Province (Blouch and Haryanto, 1984; Blouch and Simbolon, 1985). However, by 2003, only three of Lampung's 12 populations were extant (Hedges <i>et al.</i>, 2005). An unknown number of Sumatra's other elephant populations remain (Blake and Hedges, 2004), and those that do are threatened by habitat loss and poaching, as a result of conflict with humans (Santiapillai and Jackson, 1990; Hedges <i>et al.</i>, 2005). Nevertheless, the island is thought to hold some of the most significant populations outside of India. For example, recent surveys in Lampung Province's two national parks, Bukit Barisan Selatan and Way Kambas, produced population estimates of 498 (95% CI=[373, 666]) and 180 (95% CI=[144, 225]) elephants, respectively (Hedges <i>et al.</i>, 2005). Bukit Barisan Selatan NP is therefore a critically important area for Asian elephant conservation. In Kalimantan, elephants occur only in the Upper Sembakung River in Tindung District, but the origin of the elephants of Borneo remains unclear and the subject of debate.</p>
Lao People's Democratic Republic	<p>In the Lao People's Democratic Republic, elephants remain widely but very patchily distributed in forested areas, both in the highlands and lowlands. Two important and likely viable populations are known, one in Xaignaboli Province west of the Mekong and one on the Nakai Plateau. The Nakai population contained 132 (95% CI=[120,149]) elephants in 2006 (Hedges <i>et al.</i>, 2007, in review). Other potentially important elephant populations occur in Phou Phanang and Phou Khao Khoay in Vientiane Province; Phou Xang He in Savannakhet Province; Dong Ampham and Dong Khanthung, including Xe Pian, close to Cambodian border; and Nam Et, Nam Xam, Phou Dendin, and Nam Ha in the north, close to the Viet Nam and Chinese borders.</p>
Malaysia	<p>In Peninsular Malaysia, the species is now mainly restricted to three major population centres: Belum Temengor, Taman Negara, and Endau Rompin; Taman Negara had an estimated population of 631 (95% CI=[436, 915]) elephants in 2007 (Hedges <i>et al.</i>, 2008); Endau Rompin had an estimated 135 (95% CI=[80, 225]) elephants in 2008 (Gumal <i>et al.</i>, 2009). On Borneo, elephants only occur in the lowlands of the north-eastern part of the island in the Malaysian State of Sabah and adjacent parts of Kalimantan (Indonesia). In Sabah, they occur in forested areas in the south, centre, and east of the State in the following Districts: Kinabatangan, Sandakan, Beluran, Lahad Datu, Tawau and Pensiangan.</p>
Myanmar	<p>The Asian Elephant has a wide but highly fragmented and poorly-known distribution in Myanmar. The five main areas of elephant abundance are: the Northern Hill Ranges, the Western Hill Ranges, Pegu Yoma (central Myanmar), Tenasserim Yoma (in the south, bordering Thailand) and Shan State or eastern Yoma.</p>
Nepal	<p>In Nepal, elephants were once widespread in the lowland Terai, but are now restricted to a few protected areas along the border with India: Royal Chitwan National Park, Parsa Wildlife Reserve, Royal Bardia National Park and Royal Suklaphanta Wildlife Reserve, and their environs. There is some movement of animals between these protected areas, and between Bardia National Park and the adjacent parts of India.</p>
Sri Lanka	<p>The species was once found throughout Sri Lanka, but today elephants are restricted mostly to the lowlands in the dry zone where they are still fairly widespread in north, south, east, north-western, north-central and south-eastern Sri Lanka; but with the exceptions of small remnant populations in the Peak Wilderness Area and Sinharaja Area, elephants are absent from the wet zone of the country. The species continues to lose range to development activities throughout the island.</p>
Thailand	<p>In Thailand, the species occurs mainly in the mountains along the border with Myanmar, with smaller fragmented populations occurring in the peninsula in the south (in several forest complexes, south to the border with Malaysia); in the northeast (in the Dong Phaya Yen-Khao Yai forest complex, including Khao Yai National Park and the Phu Khieo-Nam Nao forest complex); and in</p>

Range State	Status
	the east (in a forest complex composing the Khao Ang Runai Wildlife Sanctuary, Khao Soi Dao Wildlife Sanctuary, Khao Khitchakut National Park and Khao Cha Mao National Park).
Viet Nam	In Viet Nam, only a small population persists now. In the northern part of the country there are no elephants left, barring occasional wanderers into Son La from the Lao People's Democratic Republic. In the central and southern parts of the country, very small isolated populations may remain in the Dak Lak, Nghe An, Quang Nam, Dong Nai and Ha Tinh Provinces.

<sup>1</sup> For further information on the categorization of data, please refer to pp. 6-16 of the AESR 2007.

<sup>2</sup> IQI: Information Quality Index. This index quantifies overall data quality at the regional level based on the precision of estimates and the proportion of assessed elephant range (i.e. range for which estimates are available). The IQI ranges from zero (no reliable information) to one (perfect information). See the AESR 2007 for details on how the IQI is calculated.
